Disclaimer

This Presentation is provided as of April 12, 2024. If you are viewing this Presentation after that date, there may have been events that occurred subsequently that could have a material effect on the information that was presented. By presenting this information, PWD has not undertaken any obligation to update the information beyond the date of the presentation. Data and other information provided are not warranted as to completeness or accuracy and are subject to change without notice. This Presentation is provided for your information and convenience only.

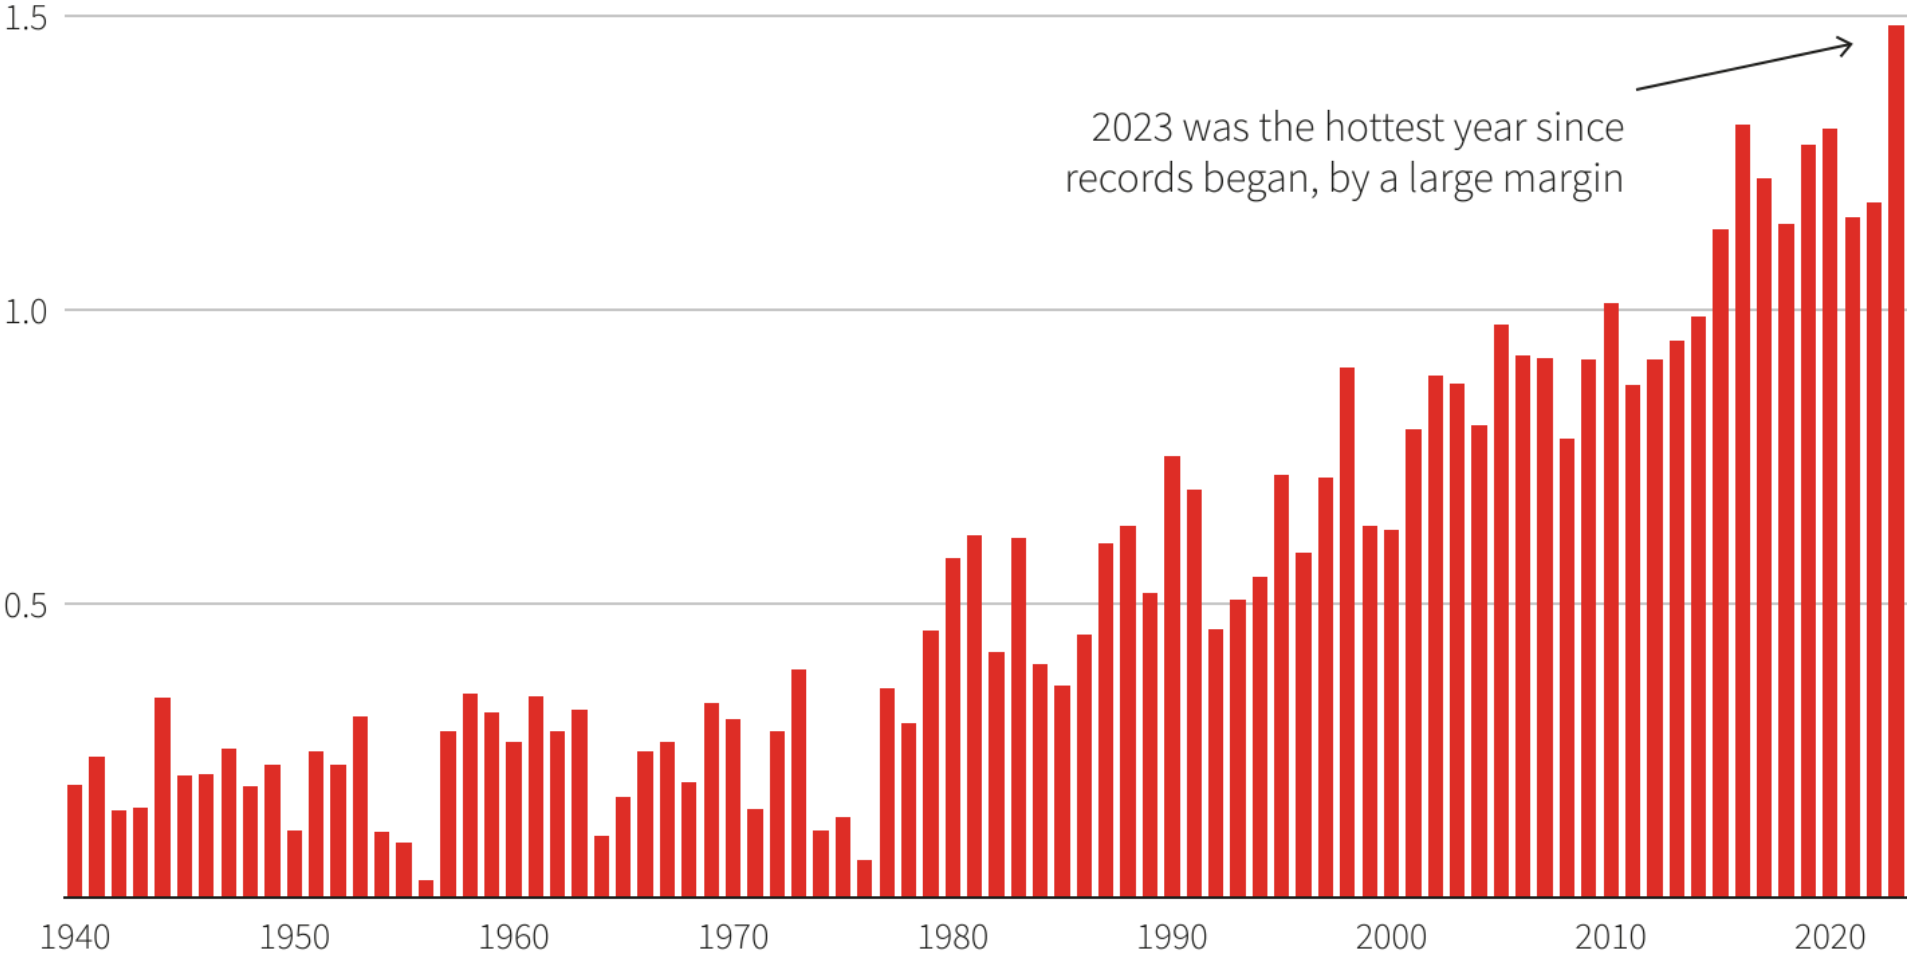

Presentation Overview

1. 2023 climate-related highlights
2. Climate change adaptation planning at PWD: approaches & examples
3. Key takeaways and lessons learned thus far

2023 Climate Highlights

2023 was the world's hottest year on record

Global surface temperature increase versus the average during the 1850-1900 pre-industrial period (°C)

Source: Copernicus Climate Change Service/ECMWF

Monthly global temperature compared with pre-industrial levels

1940s-60s 1970s 1980s 1990s 2000s 2010s 2020s

Source: Copernicus/ECMWF

AR6 Synthesis Report: Climate Change 2023

REPORT

The IPCC finalized the Synthesis Report for the Sixth Assessment Report during the Panel's 58th Session held in Interlaken, Switzerland from 13 - 19 March 2023.

*This Synthesis Report (SYR) of the IPCC Sixth Assessment Report (AR6) summarizes the **state of knowledge** of climate change, its widespread **impacts and risks**, and climate change **mitigation and adaptation**.*

READ THE REPORT

CORE WRITING TEAM

Fifth National Climate Assessment (NCA5)

Released November 14th, 2023 (<https://nca2023.globalchange.gov>). Key takeaways include:

- Climate change will continue to cause profound changes in the water cycle
- Extreme events are becoming more frequent and severe
- Effective adaptation requires centering around equity

A warming planet means a changing water cycle

A warming planet also means a changing *urban* water cycle

Adapted from 'The Urban Water Cycle' by Robert B. Sowby

Primary Strategies to Ensure Climate Resilience

Mainstreaming

Generating **actionable science and tools** and **mainstreaming** the use of climate projections in all planning and design processes

Assessing & Addressing Risks

Carrying out **risk assessments** and identifying specific adaptation strategies to reduce climate-related risks

Mainstreaming increases resilience of core services

- Water Revitalization Plan
- Wastewater Master Plan
- Stormwater Obligations
 - Green City, Clean Waters
 - MS4 Planning
- Capital Planning
- Source Water Protection & Planning
- Water Supply Planning

PWD Climate-Resilient Planning & Design Guidance

- PWD's fundamental reference document for **mainstreaming** the use of climate change information at PWD
- Provides guidance on what climate change projections PWD staff and consultants should use in infrastructure planning and design processes
- Department-wide policy requiring use of the Guidance document was established in January 2022
- This is a **living document** that reflects the latest science, projections and tools. V1.1 update released this year (2024)

Extreme Precipitation Analysis

- **The issue:** Global Climate Models (GCMs) underestimate precipitation extremes
- Identified as ‘area for future consideration’ in Version 1.0 of PWD’s *Climate-Resilient Planning and Design Guidance*
- Starting point: extensive literature research

Atlas 15 is on the horizon, but still a few years away from completion

NOAA Atlas 15

New National Precipitation Frequency Standard

Historical and future intensity-duration-frequency estimates (IDFs)

[NOAA Atlas 15 Flyer.pdf \(weather.gov\)](#)

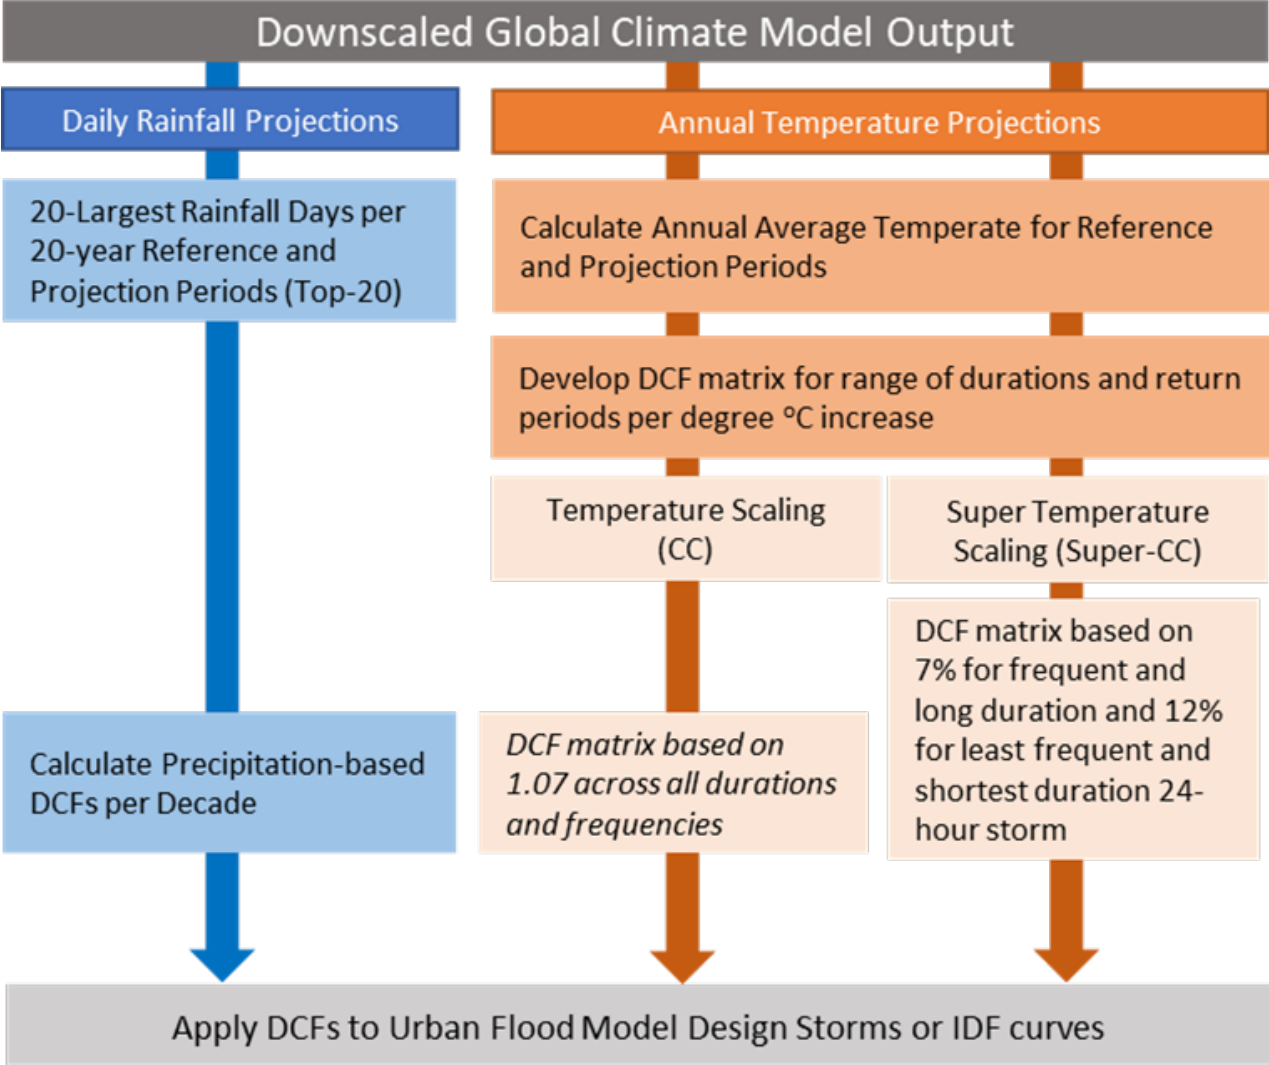

A temperature-based approach

Atmospheric holding capacity

- Modeling and data trends in extreme rainfall are now documenting **~7% per degree Celsius increase** at the daily scale (**Clausius-Clapeyron principle**)
- But recent research indicates *intensification can be greater than 7% per degree Celsius* (**‘Super Clausius-Clapeyron’**)
- IPCC6 Report and scientific literature indicate:
 - Greater temperature increases = larger precipitation intensity/volume increases
 - Shorter duration events **and** less frequent events = larger intensity/volume increases

Extreme Precipitation Analysis

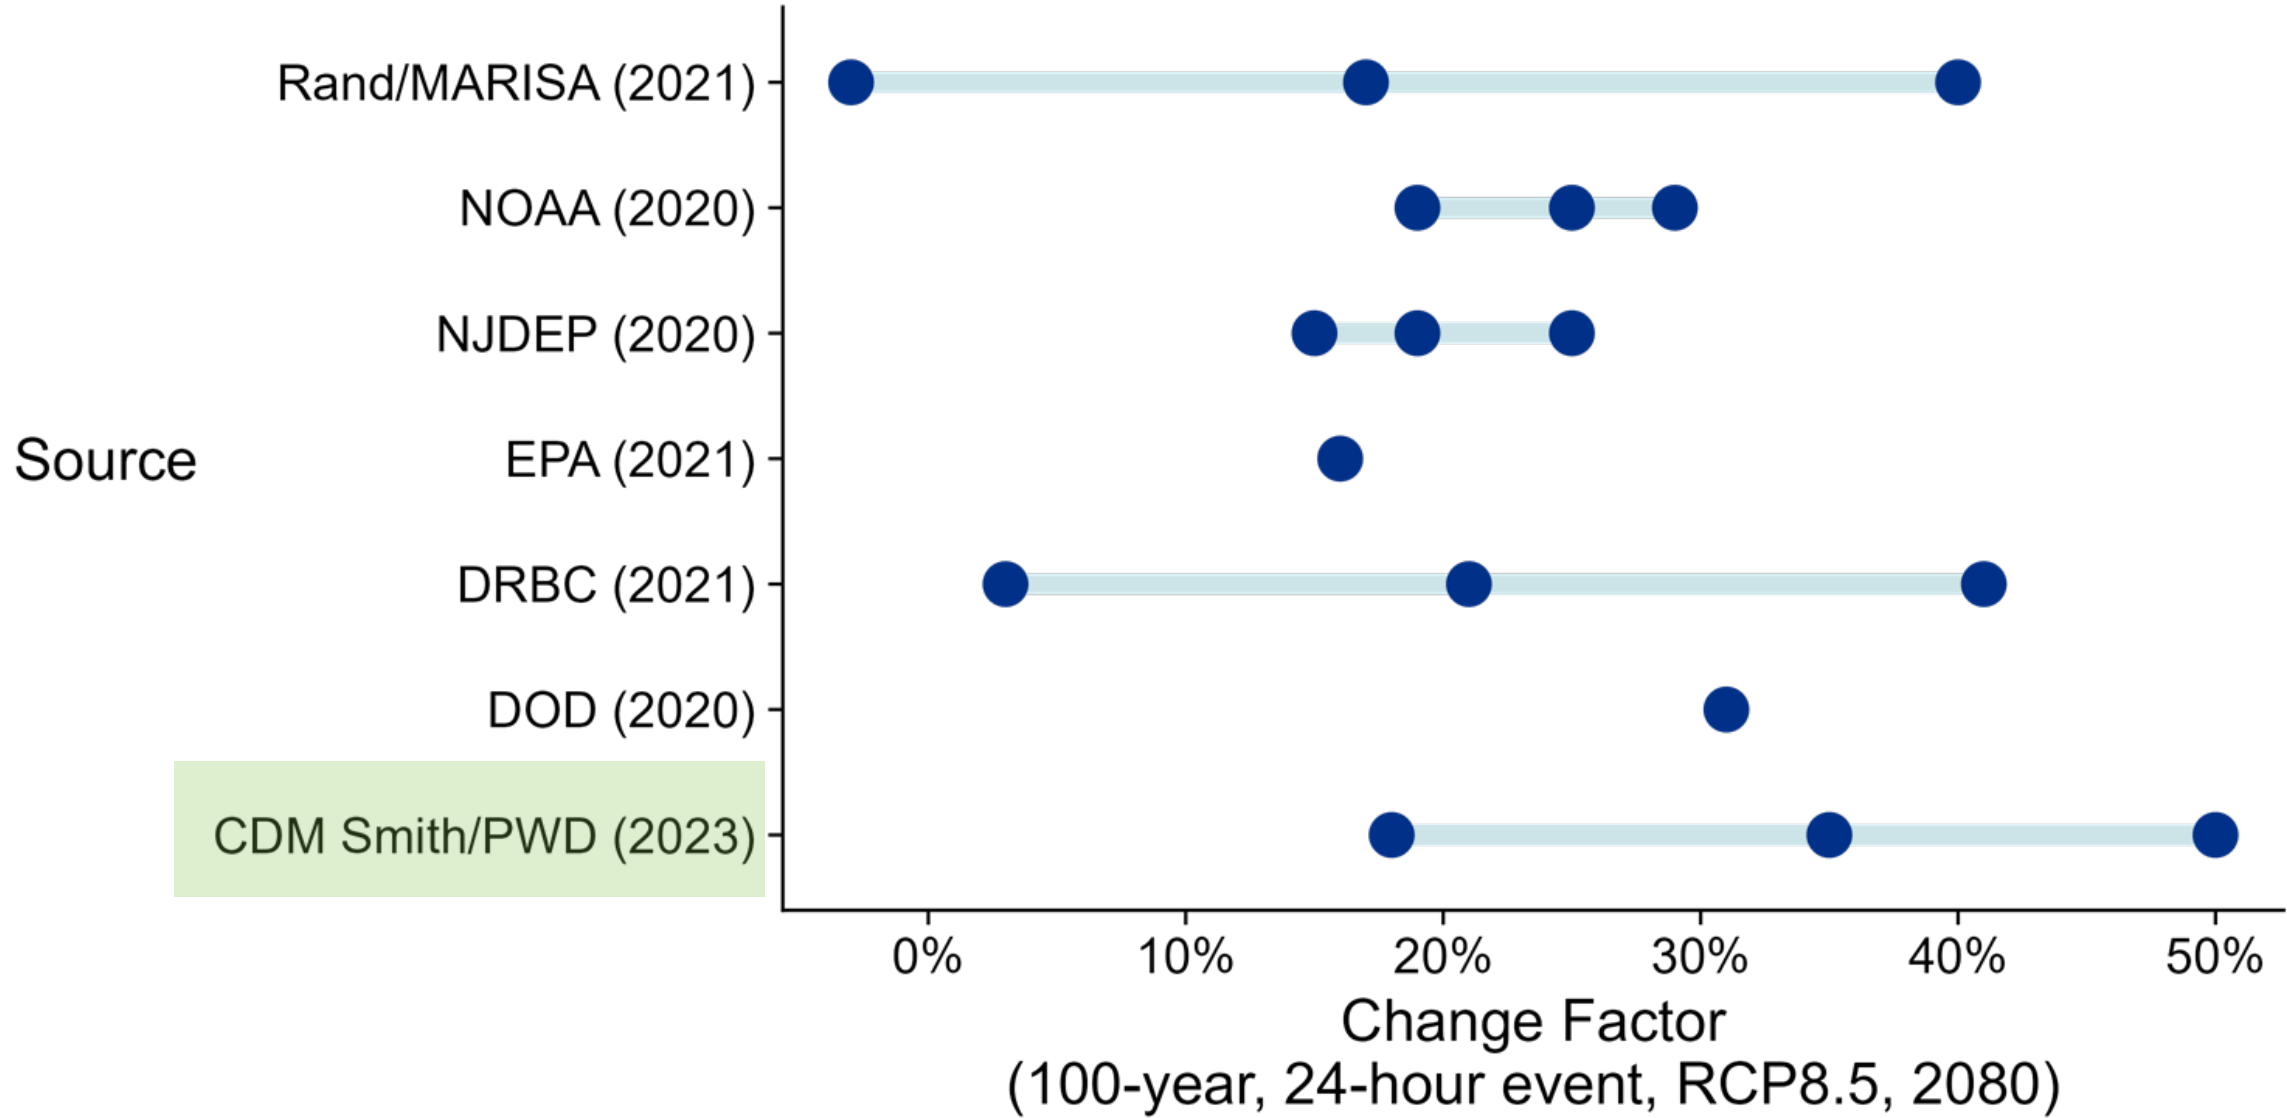

- CCAP and our consultant, CDM Smith, ultimately developed three methods to estimate increases in extreme rainfall (Low, Mid, High)
 - Low approach still relies on rainfall projections
 - Mid and High methods use temperature-based approach, that relies on more accurate GCM temperature output
 - RCP8.5 Emission Scenario

Results: Precipitation Delta Change Factors

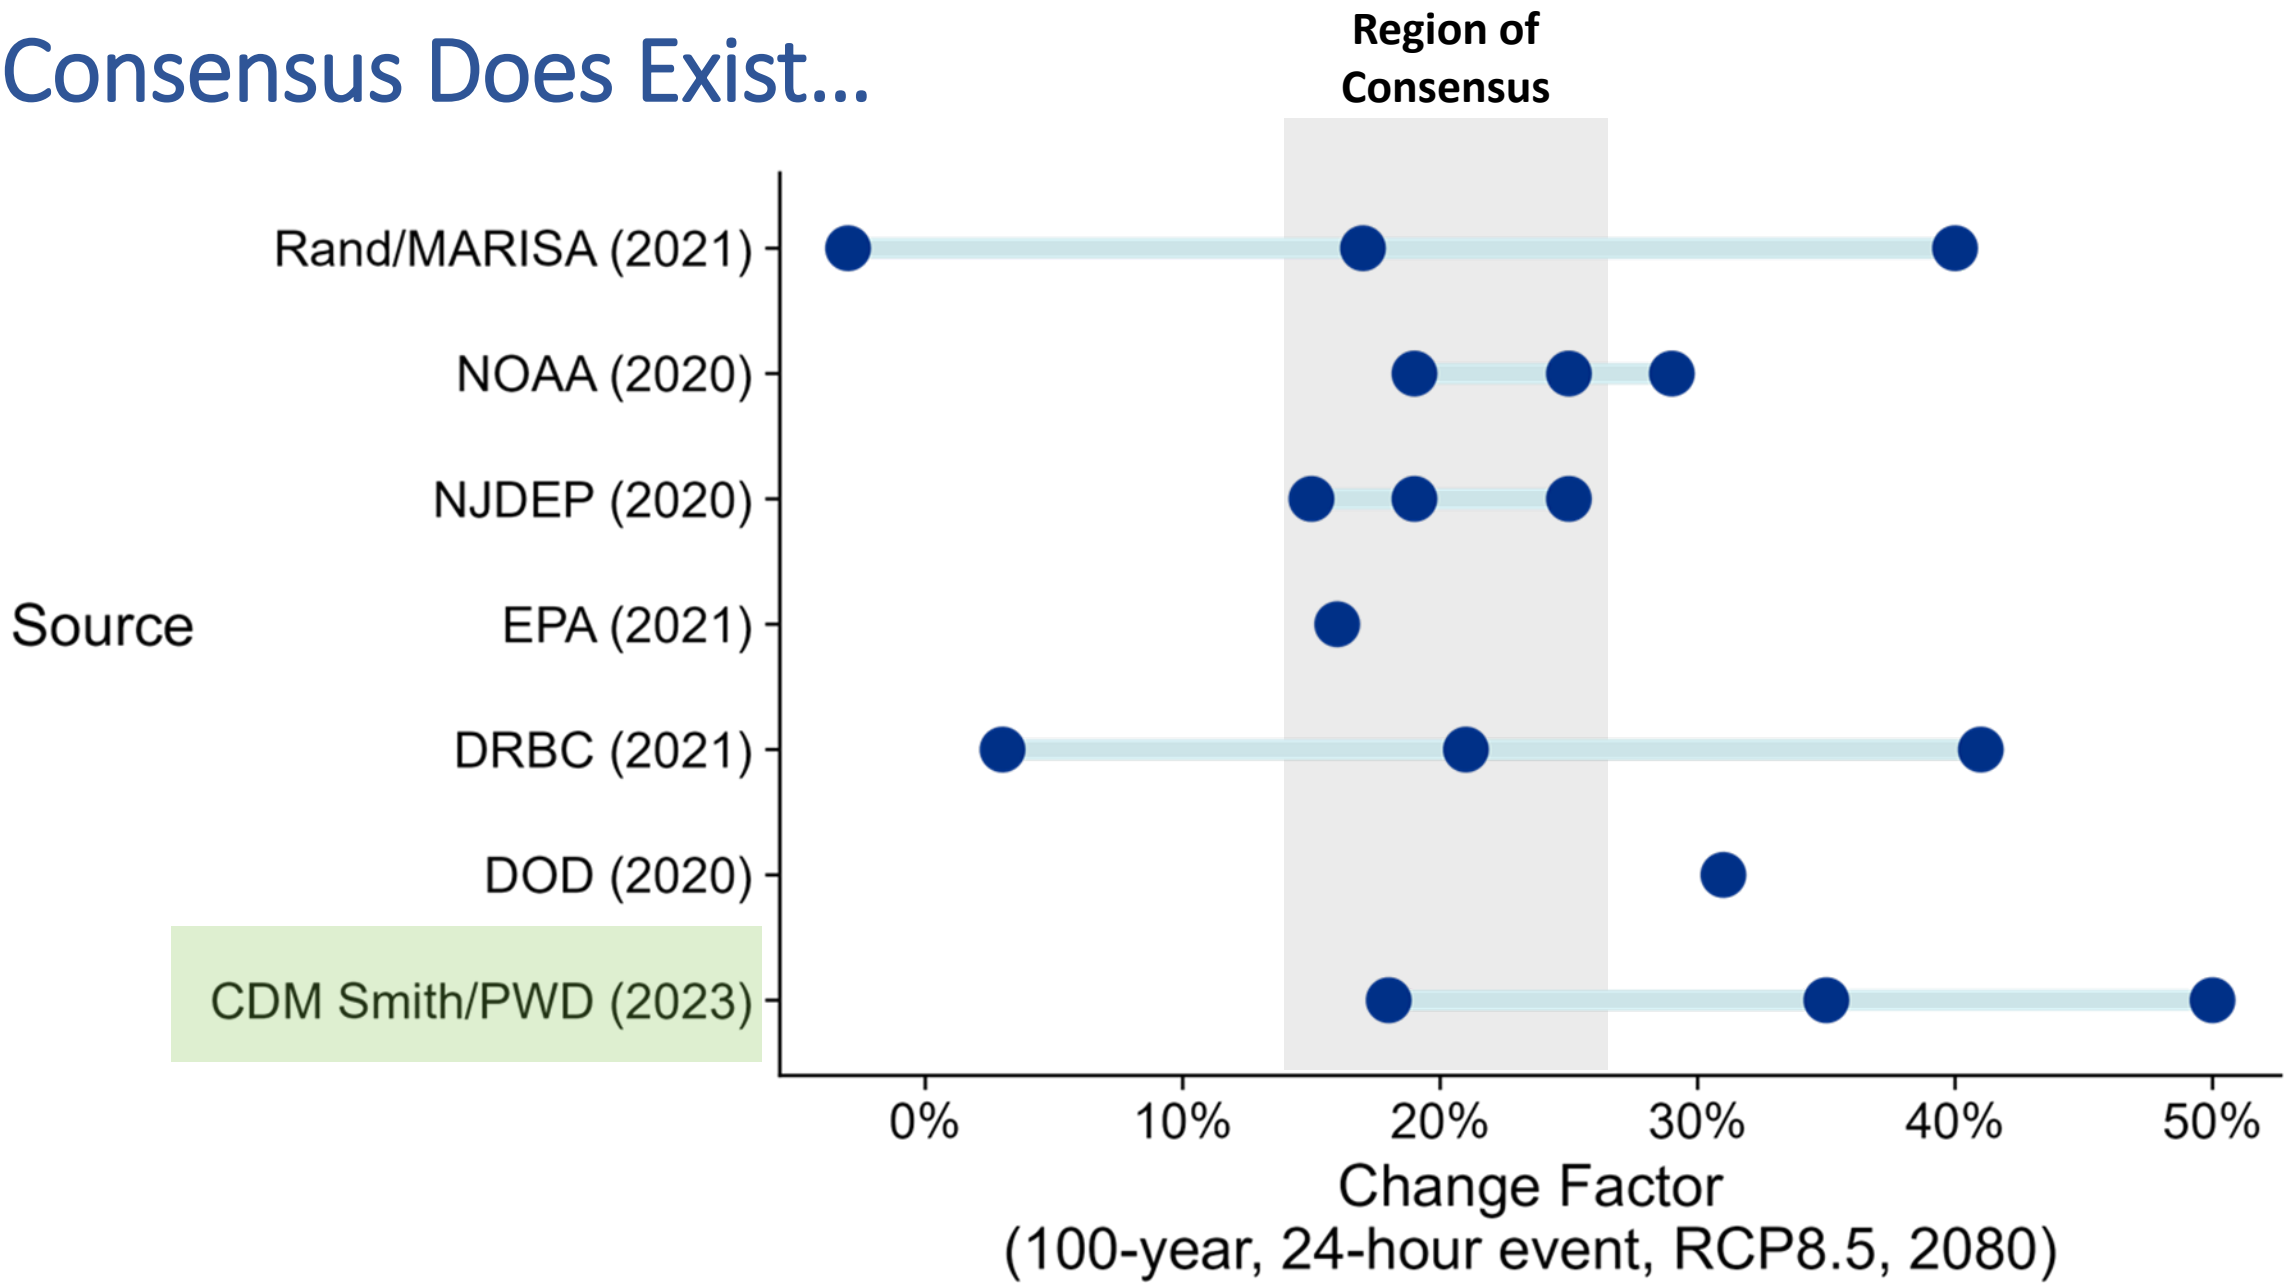

CCAP DCF Estimates for 100-yr				
Duration	C-C		Super C-C	
	2050s	2080s	2050s	2080s
1-hour	1.23	1.35	1.39	1.60
2-hour	1.23	1.35	1.38	1.58
3-hour	1.23	1.35	1.37	1.56
6-hour	1.23	1.35	1.35	1.54
12-hour	1.23	1.35	1.34	1.52
24-hour	1.23	1.35	1.33	1.50

CCAP Depth Estimates for a 24-hr Duration					
Return Period(yr.)	Baseline Depth(in)	C-C		Super C-C	
		Depth in 2050s (in)	Depth in 2080s(in)	Depth in 2050s (in)	Depth in 2080s(in)
100	9.13	11.23	12.35	12.13	13.73

[Three methods of characterizing climate-induced changes in extreme rainfall: a comparison study | Journal of Water and Climate Change | IWA Publishing \(iwaponline.com\)](https://www.iwaponline.com/journal/article/doi/10.1080/107026923.2023.2288888)

Volume 14, Issue 11

1 November 2023

What risks will water utilities face due to more extreme precipitation events?

Source: [The Philadelphia Inquirer](#). A \$37 million floodwall at the New Jersey American Raritan-Millstone Water Treatment Plant in Bridgewater, NJ successfully withstood a raging torrent last month after the remnants of Hurricane Ida deluged the region.

Fall 2021: Hurricane Ida impacts PWD infrastructure

How will climate change impact riverine flooding in Philadelphia?

How can riverine flooding risks be addressed in the PWD Water Revitalization Plan, considering climate change impacts and the increasing intensity and frequency of extreme precipitation events?

Riverine Flood Protection

Changing Flood Return Intervals

Flows from Hurricane Ida on the Schuylkill		
<i>Based on outdated flow data (1964 - 2002)</i>	<i>Based on current flow data from the last 20 years (2000-2021)</i>	<i>End-of-century projections using a high emissions scenario</i>
~65-year event 	~30-year event 	~6-year event
<i>1.5% chance of occurring in any given year</i>	<i>3.3% chance of occurring in any given year</i>	<i>16.7% chance of occurring in any year</i>
<i>32% chance of occurring over a 25 year period</i>	<i>57% chance of occurring over a 25 year period</i>	<i>99% chance of occurring over a 25-year period</i>

Riverine Design Flood Elevation (DFE) Methodology

Downscaled Global Climate Model (GCM) outputs for the Schuylkill River Watershed

Calculate Delta Change Factors (DCFs) to estimate the percent change in future streamflow decade-by-decade

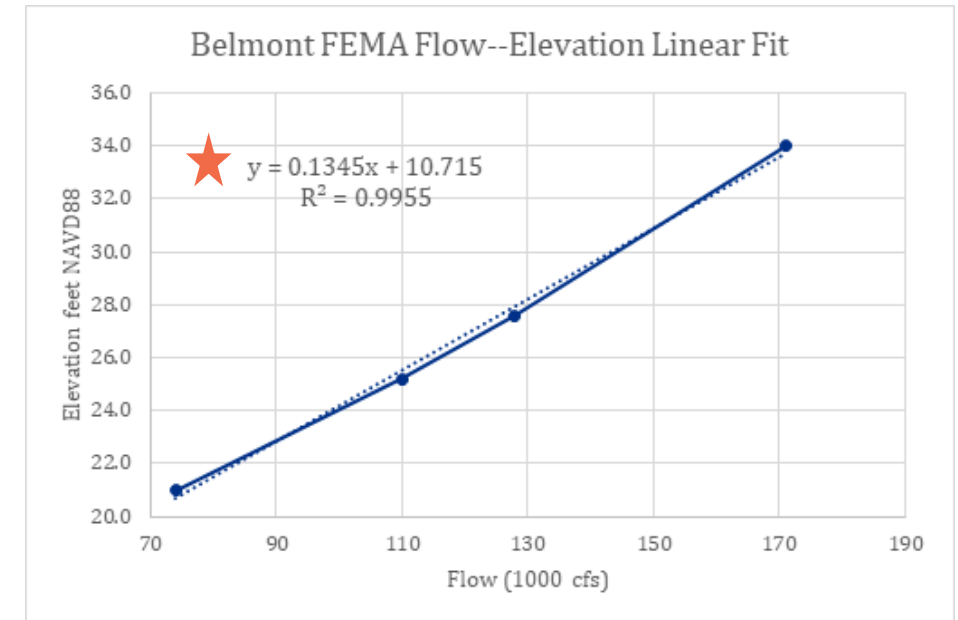

GCM nodes for the Schuylkill River watershed used in calculating DCFs

RCP8.5 Delta Change Factors	
20-year mid-point	Schuylkill Watershed
2020	24%
2030	28%
2040	29%
2050	25%
2060	32%
2070	41%
2080	53%
2090	60%

Future streamflows and elevations

Input climate-adjusted future streamflows in flow-elevation equation to determine future flood elevations

Riverine DFE Results

Schuylkill River at Belmont RWPS

At the Belmont RWPS: Flows and Associated River Elevations for RCP8.5									
Decade (year)	DCF	Return interval							
		10-year		50-year		100-year		500-year

Riverine DFE Results

Application to Belmont Raw Water PS Alternatives

Alternative	Near Term (to 2050)	Mid-Century (2050-2075)	End of Century (2075+)
1. Rehabilitation of Existing Pump Station	29.1 feet	34 feet	34 feet + AMP
2. Construction of New 80 MGD Pump Station (North Site)	31.3 feet	36 feet	36 feet + AMP
3. Construction of New 80 MGD Pump Station (South Site)	29.1 feet	34 feet	34 feet + AMP

Potential adaptation measures

Consideration for adaptation measures: an “onion analogy” of layers

- Within the facility: protecting individual assets (e.g., electrical, pumps, distribution pipes)
- Facility interior (facility structure)
- Facility exterior (facility structure)
- Surrounding facility

Base Profile: Elevations according to NAVD88

Adaptive Pathway Planning // Schuylkill River Flooding

T1	River elevation reaches within X" of DFE level
T2	River elevation reaches within X" of DFE + 6"
T3	River elevation reaches beyond critical asset maximum threshold

Graphic for demonstration purposes only

Base Profile Design (Design Flood Elevation Only)

- ▲ Trigger new action
- ⊕ Course change
- Adaptation strategy is no longer viable

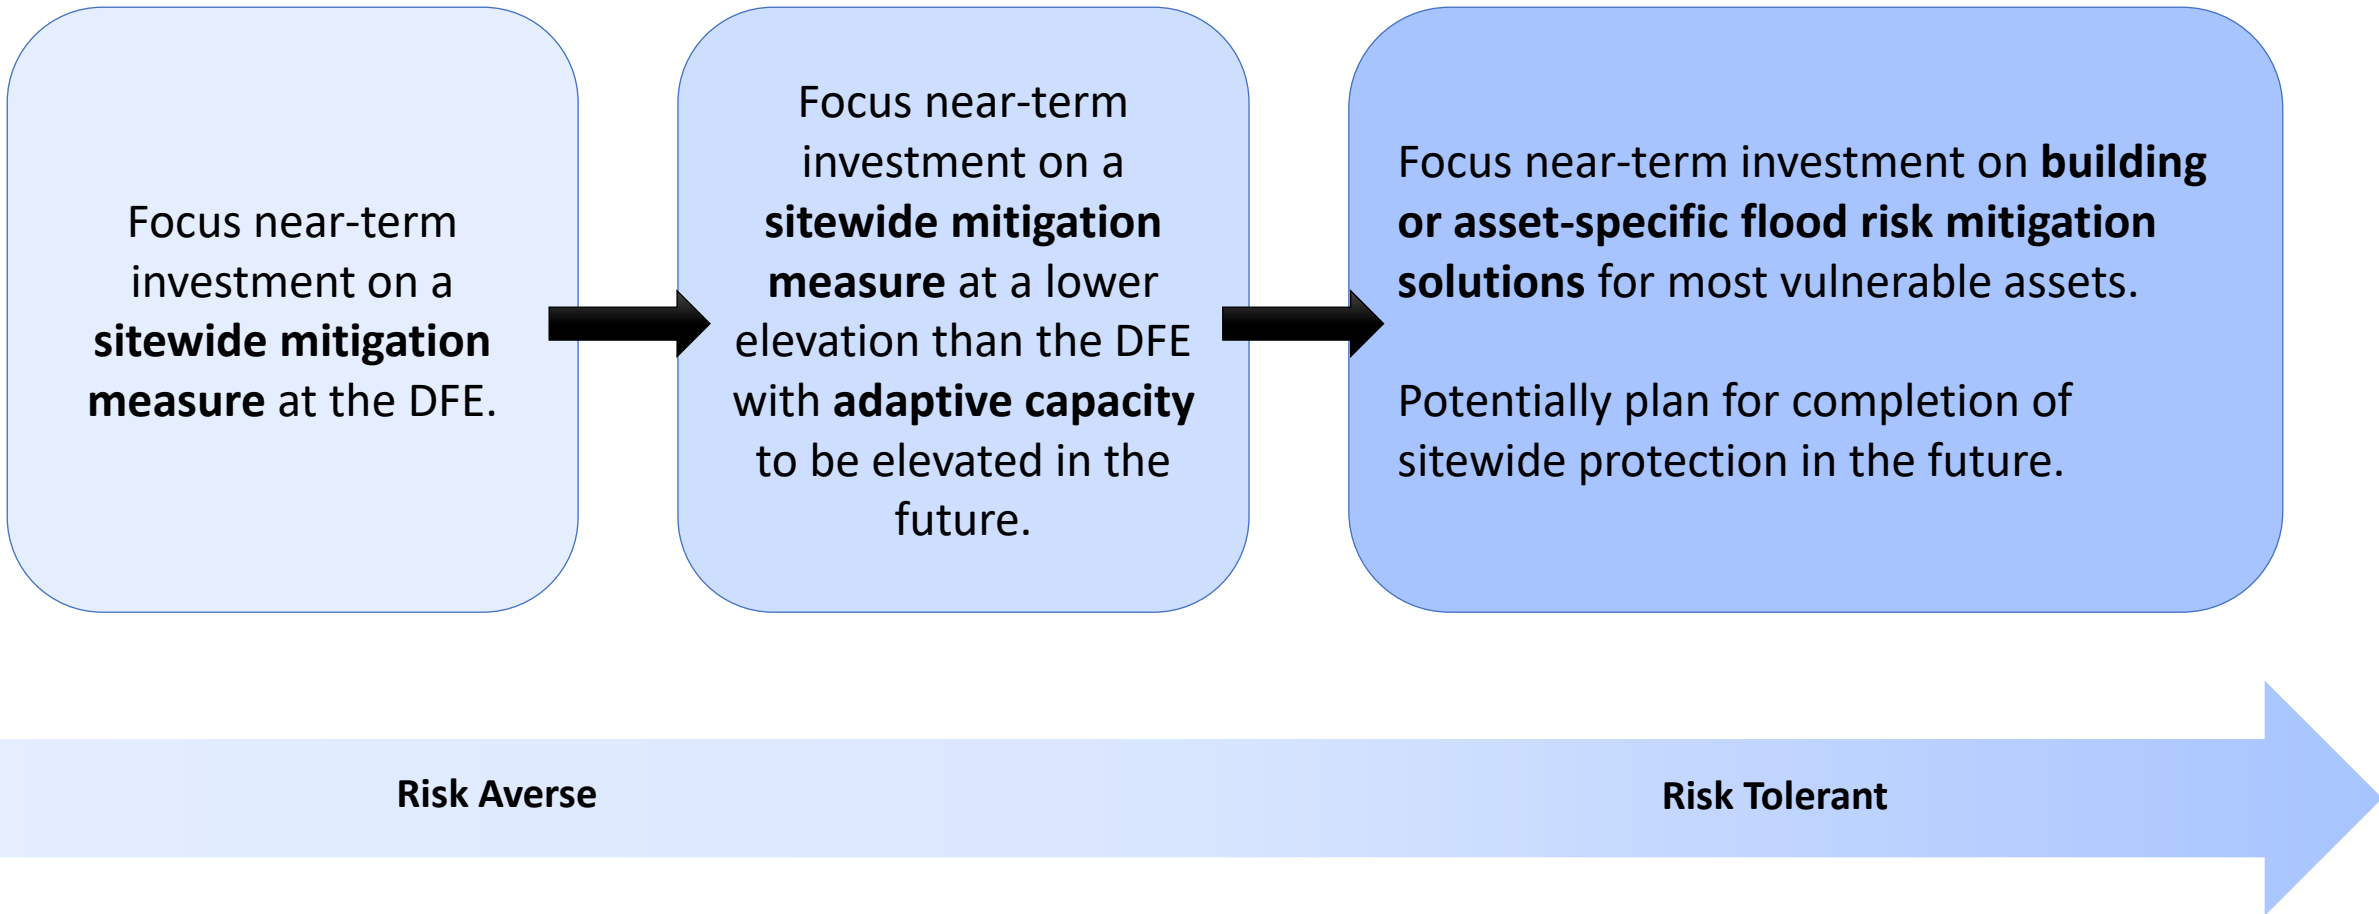

Lead Time (planning/design) Implementation

A1	Elevate entry (Building entryways)
A2	Flood damage-resistant materials
A3	Remote shutoff (electrical & monitoring equipment)
A4	Elevate entry (office)
A5	Remote shutoff (generator)
B1	Retractable gate
B2	Seal openings
B3	Floodproof/accessible doorway
B4	Exterior floodwall (on-site)
B5	Elevate equipment (electrical & monitoring instruments)
B6	Elevate equipment (generator)
B7	Elevate equipment (process mechanical/pump motor)
C1	Green spaces (surrounding facility)
C2	Pervious surfaces (surrounding facility)

Increasing Schuylkill River Levels

Flood Resilience & Risk Tolerance

Coastal and Riverine Flooding Applications

Key Takeaways & Lessons Learned

Adaptation Planning & Risk Reduction

Reduce risks and ensure utilities can:

- Continue meeting evolving and more stringent regulatory requirements
- Maintain high levels of service as infrastructure ages, land develops, environmental conditions change
- Provide equitable service delivery
- Maintain affordability and financial stability

Rendering of Sunken Basketball Court at South Jamaica Houses, Queens, NY

PWD Takeaways & Lessons Learned: Climate Science

- Considerable effort may be required to make climate science actionable
- ...but the adaptation field is rapidly evolving with new tools and resources being released regularly!
- Uncertainty in projections needs to be understood and dealt with by considering the specific application
 - Asset Criticality
 - Asset Useful Service Life
 - Adaptive Capacity
 - Risk Tolerance
- More complex isn't always better

PWD Takeaways & Lessons Learned: Planning & Implementation

- Don't let perfect be the enemy of progress
- Be prepared for a longer-term, iterative and evolving process.
- Partnerships and forums for info. exchange are crucial
- Staff engagement is key to acceptance and buy-in
- At PWD, a policy was needed to drive change and ensure consistent use of new information

Virtual - October 2023 ^

This workshop was designed around a need identified by two WUCA member agencies, the Philadelphia Water Department (PWD) and the NYC Department of Environmental Protection (NYCDEP), to build stronger connections among water agencies and climate scientists who focus their work in the Delaware River Basin.

The workshop increased Basin stakeholders' collective understanding of both water sector and climate change planning challenges and provided tools and case studies on how to overcome these challenges and successfully adapt, even amid deep uncertainty.
